Thermocouple Extension Wire

SFSF Synthetic Fiber

PRODUCT DESCRIPTION

Tough, heavy insulated for use where abrasion resistance on braided insulation is required. Conductors are insulated with a braided composite synthetic yarn and impregnated with a colorcoded moisture resistant saturant. The insulated conductors are laid parallel and insulated with a heavy yarn composite synthetic fiber jacket which is then coated with the same saturant*

PERFORMANCE FEATURES

- Designed for continuous use at temperatures to 500°F (260°C), intermittent use to 650°F (340°C).
- Excellent abrasion and good chemical resistance.

APPLICATIONS

.

- Glass & ceramic manufacturing
- Heat treating
- Metal working plants

* Above construction can be supplied with skived Teflon[®] tape over each conductor prior to applying the synthetic overbraid for increased chemical resistance. Contact us for the part number and ordering information.

Overall - Yellow

Teflon is a trademark of E.I. DuPont.
